Г

PROJECT VERIFICATION REPORT

Section A. Executive summary

Climekare Sustainability Pvt Ltd. has contracted SQAC Certification Pvt Ltd. to carry out the verification of the project activity of 26 MW Bagasse based Co-generation by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd. Dist. Ahmednagar, Maharashtra, India. UCR approved Project ID: **441**, to establish number of CoUs generated by project over the crediting period from **01/01/2021 - 31/12/2023** (3 years 00 months)

We believe that the total GHG emission reductions over the crediting / verification period stated in the Monitoring Report V1 (MR), submitted to us is accurate and in line with the UCR guidelines.

The GHG emission reductions were calculated based on UCR Protocols which draws reference from, ACM0006: Electricity and heat generation from biomass (Ver. 16) & UCR Standard for Emission Factor. The verification was done remotely by way of video calls / verification, phone calls and submission of documents for verification through emails as per UCR guidelines.

SQAC is able to certify that the emission reductions from 26 MW Bagasse based Cogeneration by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd., Dist. Ahmednagar, Maharashtra. (UCR ID – **441**) for the period **01/01/2021 to 31/12/2023** amounts to **60,871 CoUs** (**60,871 tCO**_{2eq})

Section C. Means of Project Verification

C.1. Desk/document review

As part of the review and validation process, Climekare Sustainability Pvt Ltd. submitted a comprehensive set of documents for examination by the Lead Verifier. The documents included the Project Concept Note V1 (PCN), Monitoring Report V1, Emission Reduction calculation sheet (ER), Bagasse consumption report (Monthly fuel usage statement, Commissioning Certificates, Credit notes, Invoices, Consent to operate Sugar plus Cogen unit, Environment Clearance, Calibration Certificates, Power Purchasing Agreement, Certificate of Verification (Load Cell test Certificate) and additional data provided upon request pertaining to all related projects. These documents were thoroughly reviewed to ensure compliance with relevant standards and guidelines, and to validate the accuracy and completeness of the information provided.

C.2. Off-site inspection

| Da | ate of offsite | | |

Section D. Project Verification Findings

D.1. Identification and eligibility of project type

| Means of Project Verification | Project Documentation: Review of the project activity description, including the purpose, technology, and equipment used. |
|-------------------------------|---|
| | Monitoring Reports: Examination of monitoring reports detailing the greenhouse gas (GHG) emission reductions achieved during the specified period. |
| | Compliance with Methodologies: Verification that the project adheres to the applied baseline methodology (ACM0006) and UCR standards for emission factors. |
| | Off-Site Inspections: Off-site inspections of the project to confirm the implementation and operation of the biomass-based co-generation power plant. |
| Findings | Upon verification, the project titled "26 MW Bagasse based Co-generation by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd." is identified as a renewable energy project utilizing biomass (bagasse) for power generation. The project is eligible under the ACM0006 methodology for |

| | electricity and heat generation from biomass, as it meets the criteria of using biomass residues without chemical or biological processing and does not involve fossil fuel co-firing exceeding 25%. Verified 140 TPH Boiler No. – MR 17782 and one each Turbine of 10 MW bearing Serial No. TST -1100-H-037 and 16 MW bearing Serial No. WC 2018 – 134C. The project displaces fossil fuel- based grid electricity, contributing to GHG emission reductions and promoting sustainable development through environmental, social, and economic benefits. |
|------------|---|
| Conclusion | In conclusion, the project titled "26 MW Bagasse based Co-generation by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd." is eligible for carbon credits. The project utilizes renewable biomass (bagasse) to generate electricity and heat, thereby reducing greenhouse gas emissions by displacing fossil fuel-based grid electricity. The project adheres to the ACM0006 methodology for electricity and heat generation from biomass and meets the criteria for renewable energy projects under sectoral scope 01. The project has successfully generated 60,871 tCO _{2eq} of emission reductions during the monitoring period from 2021 to 2023, confirming its compliance and effectiveness in contributing to climate change mitigation. |

Γ

D.2. General Description of Project Activity

| Means of Project Verification | Operational Records: Documentation of the |
|-------------------------------|---|
| | project's operational status, including power generation and usage. |
| | Off-Site Inspections: Verification of the project site to ensure compliance with the described activities and equipment. |
| | Meter Readings: Continuous monitoring and recording of electricity generation and consumption data. |
| | Environmental Impact Assessments: Review of environmental benefits and compliance with regulations. |
| Findings | Upon verification, it was found that the project is a bagasse-based co-generation power project located in Ahmednagar, Maharashtra. It was successfully commissioned by the Maharashtra State Electricity Transmission Company Limited (MSETCL) and has been operational since August 28, 2019. The project involves setting up an integrated new sugar mill with a crushing capacity of 5000 TCD and a 26 MW bagasse-based co-generation power plant. The primary purpose of this project is to generate electricity using renewable biomass (bagasse), thereby reducing GHG emissions by displacing fossil fuel-dominated grid electricity with biomass-based renewable electricity. The project has generated clean energy, meeting its captive requirements and exporting excess energy to the Maharashtra State Energy Distribution Company Limited (MSEDCL). This initiative contributes to climate change mitigation by reducing anthropogenic GHG emission. |

Conclusion

In conclusion, the project titled "26 MW Bagasse based Co-generation by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd." is a renewable energy initiative that utilizes bagasse, a by-product of sugar production, to generate electricity and heat. Operational since August 28, 2019, the project aims to reduce dependency on fossil fuels by supplying power to the sugar mill and exporting excess electricity to the Maharashtra State Energy Distribution Company Limited (MSEDCL). This initiative not only mitigates greenhouse gas emissions by displacing fossil fuel-based electricity but also contributes to sustainable development through social, environmental, economic, and technological benefits. The project has successfully generated 60,871 tCO_{2eq} in emission reductions over the monitoring period from 2021 to 2023.

D.3. Application and selection of methodologies and standardized baselines

D.3.1 Application of methodology and standardized baselines

Г

| Means of Project Verification | Monitoring of Electricity Data: Power generation from turbine generators and auxiliary consumption are metered and recorded hourly. This data is verified by the power plant manager and reviewed during quarterly meetings. Operational Records: Documentation of operational records and evidence, maintained in hard copies or electronic formats. Calibration of Meters: All meters are checked and calibrated by an independent agency, ensuring accuracy. Internal Audits: An internal audit team reviews daily and monthly reports, data recording procedures, and maintenance reports of the |
|-------------------------------|---|
| Findings | meters. Upon verification, it was found that the project activity involves the generation of grid-connected electricity from a 26 MW bagasse-based co- generation power plant. The applied baseline methodology is ACM0006: "Electricity and heat generation from biomass" (Version 16). The project meets the applicability criteria, as it uses 100% bagasse during the crushing season and does not involve biogas production or chemical processing of biomass. The project is not a de- bundled component of a larger project and does not cause double accounting of carbon credits. The project boundary includes all plants generating power and/or heat at the project site and all power plants connected to the grid. The baseline scenario involves the displacement of |

| | more GHG-intensive electricity generation from |
|------------|--|
| | the grid. The project successfully avoids fossil |
| | fuel emissions by using GHG-neutral biomass, |
| | contributing to significant GHG emission |
| | reductions. |
| | |
| Conclusion | In conclusion, the project activity involves the generation of grid-connected electricity from a cogeneration power-based project using bagasse as biomass. The methodology ACM0006, Version 16, is applicable as the project meets the criteria, including the use of biomass residues, no chemical or biological processing of biomass, and the project being a new greenfield initiative. The project does not involve biogas production or dedicated biomass plantations, ensuring compliance with the methodology's applicability conditions. Therefore, the application of the methodology and standardized baselines is appropriate and justified for this project. |

D.3.2 Clarification on applicability of methodology, tool and/or standardized baseline

| Means of Project Verification | Review of Project Documentation: Examination of all relevant project documents, including the Project Concept Note (PCN), monitoring reports, and any other supporting documents. |
|-------------------------------|--|
| | Off-Site Visits: Conducting off-site inspections to verify the physical implementation of the project and the operational status of the equipment. |
| | Interviews: Engaging with project participants, including the project proponent, operators to gather firsthand information. |
| | Data Analysis: Analysing the data collected from the project site, including energy generation records, fuel usage, and emission reduction calculations. |
| Findings | Upon verification, it confirms that the project activity is a 26 MW bagasse-based co-generation power plant, adheres to the ACM0006 methodology for electricity and heat generation from biomass (Version 16). The project employs biomass residues (bagasse) without chemical or biological processing, ensuring compliance with the methodology's criteria. Additionally, the project does not involve biogas production or dedicated biomass plantations, further aligning with the specified conditions. The project effectively displaces fossil fuel-based grid electricity, contributing to significant GHG emission reductions, and meets all the necessary requirements for carbon credit issuance under the UCR protocol. |
| Conclusion | In conclusion, the project activity involves the generation of grid-connected electricity from a 26 |

| MW bagasse-based co-generation power plant. The methodology ACM0006, Version 16, is applicable as the project uses biomass residues (bagasse) without any chemical or biological processing prior to combustion. The project does not involve biogas production or dedicated biomass plantations, and it adheres to the criteria for biomass storage and processing. Therefore, |
|--|
| the methodology and standardized baseline are |
| applicable, ensuring accurate monitoring and |
| reporting of GHG emission reductions. |

D.3.3 Project boundary, sources and GHGs

| Means of Project Verification | Project Boundary: Verification will involve confirming the spatial extent of the project boundary, which includes all plants generating power and/or heat at the project site and all power plants connected to the electricity system (grid). |
|-------------------------------|---|
| | Sources and GHGs: Verification will ensure that the project uses GHG-neutral biomass (Bagasse) and avoids fossil fuel emissions. The primary GHG considered is CO ₂ , with CH ₄ and N2O excluded for simplification. |
| | Emission Reductions: Verification will involve calculating emission reductions based on the baseline emissions, project emissions, and leakage emissions, ensuring accurate and conservative estimates. |
| Findings | Upon verification, the project boundary for the 26 MW Bagasse-based Co-generation project includes all plants generating power and/or heat at the project site, whether fired with biomass, fossil fuels, or a combination of both, as well as all power plants connected to the electricity grid. |

| | The primary source of greenhouse gas (GHG) |
|------------|--|
| | emissions in the baseline scenario is the burning |
| | of fossil fuels in boilers, specifically CO_2 |
| | emissions. In the project scenario, emissions |
| | from biomass combustion are excluded for |
| | simplification. The project successfully avoids |
| | fossil fuel emissions by using GHG-neutral |
| | biomass (bagasse), thus reducing GHG emissions |
| | from in-house cogeneration energy requirements |
| | and vehicular emissions from sourcing biomass |
| | fuel. |
| | |
| Conclusion | In a maluation, the music at her malant for the OC MIN |
| Conclusion | In conclusion, the project boundary for the 26 MW |
| | Bagasse-based Co-generation project |
| | encompasses all plants generating power and/or |
| | heat at the project site, whether fired with |
| | biomass, fossil fuels, or a combination of both, as |
| | well as all power plants connected to the MSETCL |
| | grid. The primary source of greenhouse gas (GHG) |
| | emissions in the baseline scenario is the burning |
| | of fossil fuels in boilers, specifically carbon |
| | dioxide (CO2). The project activity itself, which |
| | uses GHG-neutral biomass (bagasse), does not |
| | produce significant GHG emissions, thus |
| | effectively avoiding fossil fuel emissions and |
| | reducing overall GHG emissions. |
| | ŭ |

D.3.4 Baseline scenario

| Means of Project Verification | Electricity Generation Records: Verification of the electricity generated by the project and supplied to Maharashtra State Electricity Transmission Company Limited (MSETCL) grid, ensuring it displaces fossil fuel-based power. |
|-------------------------------|--|
| | Emission Factor: Confirmation of the grid emission factor used to calculate baseline emissions. |
| | Fuel Records: Examination of the type and quantity of biomass (bagasse) used, ensuring it aligns with the project's claims. |
| | Operational Data: Review of operational records to ensure the project operates as described and meets the criteria for renewable energy generation. |
| Findings | Upon verification, the baseline scenario for the 26 MW Bagasse-based Co-generation project by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd. involves the displacement of more GHG-intensive electricity generation from the Indian grid, which is predominantly fossil fuel-based. Without the project, the equivalent amount of electricity would have been imported from the regional grid, leading to higher carbon emissions. The project, by utilizing biomass (bagasse) for power generation, successfully avoids these emissions, contributing to climate change mitigation by reducing the reliance on fossil fuels and promoting renewable energy sources. |
| Conclusion | In conclusion, it involves the displacement of more GHG-intensive electricity generation from the Indian grid, which is predominantly sourced |

| from fossil fuel-based power plants. By utilizing bagasse, a renewable biomass, the project successfully avoids fossil fuel emissions, thereby reducing GHG emissions. The project replaces an equivalent amount of electricity that would have otherwise been generated by fossil fuel-based power plants, contributing to climate change mitigation by reducing anthropogenic emissions |
|--|
| mitigation by reducing anthropogenic emissions of greenhouse gases. |

D.3.6 Estimation of Emission Reductions or Net Anthropogenic Removal

| Means of Project Verification | Monitoring of Electricity Data: Power generation from turbine generators and auxiliary |
|-------------------------------|---|
| | consumption are metered and recorded continuously on an hourly basis. |
| | Operational Records: Documentation and archiving of operational records and other evidence in both hard-copy and electronic formats. |
| | Calibration of Meters: Regular calibration of all meters by an independent agency to ensure accuracy. |
| | Internal Audits: An internal audit team reviews daily reports, monthly reports, data recording procedures, and maintenance reports of the meters. |
| Findings | Upon verification, the project titled "26 MW Bagasse based Co-generation by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd." achieved a total GHG emission reduction of 60,871 tCO _{2eq} during the monitoring period from 2021 to 2023. The |
| | baseline emissions were calculated as 68,249 |

| | tCO _{2eq} , and project emissions were 6,823 tCO _{2eq} . The project successfully displaced fossil fuel- based electricity with renewable biomass-based electricity, contributing to climate change mitigation by reducing anthropogenic GHG emissions. The findings indicate that the project effectively reduced emissions and met its environmental objectives. |
|------------|--|
| Conclusion | In conclusion, the project activity successfully reduced greenhouse gas emissions by displacing fossil fuel-based electricity with renewable biomass energy. The total emission reductions achieved during the monitoring period from 2021 to 2023 amount to 60,871 tCO _{2eq} . This was calculated by subtracting project emissions and leakage from the baseline emissions, demonstrating the project's effectiveness in mitigating climate change. |

D.3.7 Monitoring Report

| Means of Project Verification | Operational Records: Documented, collected, and archived in either hard copies or electronic formats. |
|-------------------------------|---|
| | Metered Data: Energy generation is metered by calibrated meters, with steam quantity, temperature, and pressure measured by calibrated meters. |
| | Daily and Monthly Reports: Data recorded hourly by operators, collated daily by the engineer in charge, and reviewed monthly by the Plant Head. |
| | Internal Audits: Conducted by an internal audit team from a different department to ensure all records are maintained as per the details provided in the Project Concept Note (PCN). |
| | |

| Findings | Upon verification, it confirms that the project successfully generated 60,871 CoUs (Carbon Offset Units) over the monitoring period from January 1, 2021, to December 31, 2023. The project utilized bagasse, a renewable biomass, to generate electricity, thereby reducing greenhouse gas emissions by displacing fossil fuel-based grid |
|------------|---|
| | electricity. The report highlights the project's compliance with the ACM0006 methodology, its contribution to sustainable development through social, environmental, economic, and |
| | technological benefits, and the absence of any significant negative environmental impacts. The project also adhered to all monitoring and verification protocols, ensuring accurate and reliable data collection and reporting. |
| Conclusion | In conclusion, the 26 MW Bagasse-based Co- generation project by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd. the project has successfully achieved significant greenhouse gas (GHG) emission reductions. Over the monitoring period from January 1, 2021, to December 31, 2023, the project generated a total of 60,871 Carbon Offset Units (CoUs) by displacing fossil fuel-based grid electricity with renewable biomass-based electricity. The project has met all the necessary criteria and methodologies, demonstrating effective implementation and contribution to climate change mitigation. Therefore, the conclusion is that the project has successfully achieved its emission reduction targets and is eligible for the issuance of carbon credits. |

D.4. Start date, crediting period and duration

| Means of Project Verification | Start Date: The project start date is 01/01/2021. Verification can be done through operational records and commissioning reports. Crediting Period: The crediting period is from 01/01/2021 to 31/12/2023. Verification involves reviewing the project registration documents and monitoring reports. Duration: The duration of the crediting period is 3 years. Verification can be confirmed by cross-referencing the project documentation and monitoring period records. |
|-------------------------------|---|
| Findings | Upon verification, the project titled "26 MW Bagasse based Co-generation by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd." has a start date of January 1, 2021. The crediting period for this project is three years, spanning from January 1, 2021, to December 31, 2023. This duration is inclusive of both the start and end dates, ensuring that all credited emissions reductions or energy generation activities are in full compliance with the relevant guidelines and accurately reflect the operational reality of the project. |
| Conclusion | In conclusion, the start date for the crediting period is 01/01/2021. The crediting period corresponding to this monitoring period is 3 years, from 01/01/2021 to 31/12/2023. This ensures that all credited emissions reductions or energy generation activities are in full compliance with the relevant guidelines and accurately reflect the operational reality of the project. There are no permanent changes in the monitoring plan and applied methodology. |

D.5. Positive Environmental impacts

| D.5. Positive Environmental impac | | |
|-----------------------------------|---|--|
| Means of Project Verification | Emission Reductions: Verification of the reduction in greenhouse gas emissions, specifically the CO _{2eq} emission reductions of 60,871 tCO _{2eq} achieved by the project. | |
| | Renewable Energy Generation: Confirmation of the electricity generated using renewable biomass (bagasse) and the amount of power exported to the Maharashtra State Electricity Transmission Company Limited (MSETCL) grid. | |
| | Environmental Benefits: Assessment of the project's contribution to reducing the use of fossil fuels and minimizing harmful emissions like NOx and SOx. | |
| | Sustainable Practices: Evaluation of the project's adherence to sustainable practices, such as the proper disposal and utilization of bagasse and compliance with environmental regulations. | |
| Findings | Upon verification, it was found that the project utilizes renewable biomass (bagasse) to generate electricity, significantly reducing greenhouse gas (GHG) emissions by displacing fossil fuel-based power. It has achieved a total reduction of 60,871 tCO _{2eq} over the monitoring period. Additionally, the project minimizes the disposal of excess bagasse, which otherwise could lead to environmental pollution, and reduces ash generation compared to coal combustion. The project also serves as a model for other sugar mills to adopt similar sustainable practices, contributing to broader environmental sustainability. | |
| Conclusion | In conclusion, the project generates renewable energy using biomass, reducing dependency on | |

| fossil fuels and minimizing greenhouse gas |
|--|
| emissions. It has achieved a reduction of 60,871 |
| $tCO_{\mbox{\tiny 2eq}}$ over the monitoring period. Additionally, |
| the project helps in reducing ash generation and |
| prevents unplanned disposal of bagasse, |
| contributing to better waste management. |
| Overall, the project significantly contributes to |
| climate change mitigation and environmental |
| sustainability. |

D.8. Project Owner- Identification and communication

| Means of Project Verification | Project Proponent: M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd. | |
|-------------------------------|--|--|
| | Aggregator: Climekare Sustainability Pvt. Ltd. Email: sustainability@climekare.com Phone: 98117525603 UCR ID: 336812961 | |
| | Documentation Review: Examining official documents, such as Factory License, MPCB Consent to Operate for the project activity dated 22/10/2023, Environment Clearance Certificate dated 11/09/2019, Commissioning Certificates to confirm the identity of the project owner. | |
| | Direct Communication: Engaging directly with the project owner to verify their identity and establish clear lines of communication for the verification process. | |
| | Public Records Check: Conducting checks on publicly available databases or registries to validate the legal status and ownership details of the project owner. | |
| Findings | Upon verification, the project owner is clearly identified and communicated as the primary | |

| | entity responsible for the 26 MW Bagasse-based | | | |
|------------|--|--|--|--|
| | Co-generation project in Ahmednagar, | | | |
| | Maharashtra. The project owner has effectively | | | |
| | communicated their role and responsibilities, | | | |
| | including the setup and operation of the co- | | | |
| | generation power plant, which utilizes bagasse as | | | |
| | a renewable biomass fuel. The project | | | |
| | documentation provides comprehensive details | | | |
| | about the project owner, including their location, | | | |
| | contact information, and their collaboration with | | | |
| | Climekare Sustainability Pvt. Ltd. as the project | | | |
| | aggregator. This clear identification and | | | |
| | communication ensure transparency and | | | |
| | accountability in the project's implementation | | | |
| | and monitoring processes. | | | |
| Conclusion | In conclusion, the project owner, M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd., has successfully implemented a 26 MW bagasse-based co- generation power project. The project has been operational since August 28, 2019, and has demonstrated significant environmental benefits by reducing greenhouse gas emissions through the use of renewable biomass. The project has also contributed to local employment and technological advancement. The communication and identification of the project owner are clear and well-documented, ensuring transparency and accountability in the project's execution and monitoring. | | | |

Positive Social Impact

| Means of Project Verification | Employment Generation: Verification of job creation for both skilled and unskilled workers in the local area for the operation and maintenance of the equipment. | |
|-------------------------------|--|--|
| | Higher Value Jobs: Confirmation of the creation of steady, higher-value jobs and skilled worker positions at the facility. | |
| | National Energy Security: Evidence of the project's contribution to national energy security by reducing fossil fuel consumption. | |
| | Technological Advancement: Verification of local capacity building and technological advancement through the project's implementation. | |
| Findings | Upon verification, the project has several positive social impacts. It contributes to employment generation in the local area, creating both skilled and unskilled jobs for the operation and maintenance of the equipment. The project has also created steady higher value jobs and skilled positions at the facility, enhancing the local workforce's capabilities. Additionally, it contributes to national energy security by reducing fossil fuel consumption and promotes technological advancement in the region, helping local people build capacity and stay updated with modern technologies. | |
| Conclusion | In conclusion, the project titled "26 MW Bagasse based Co-generation by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd." has demonstrated significant positive social impacts. It has generated employment opportunities for both skilled and unskilled workers in the local area, contributing to | |

| the national energy security by reducing fossil fuel |
|--|
| consumption. The project has created steady, |
| higher-value jobs and promoted technological |
| advancements, thereby aiding in capacity building |
| among local people. Additionally, it has fostered |
| economic growth by increasing the demand for |
| bagasse, benefiting local sugarcane farmers and |
| supporting the sustainable development of the |
| region. |

Sustainable development aspects (if any)

| Means of Project Verification | Employment Generation: Verification through employment records and job creation statistics. Environmental Impact: Monitoring reports on GHG emission reductions and compliance with environmental regulations. Technological Advancements: Documentation of technology used and its efficiency in reducing emissions. Economic Benefits: Financial records showing revenue generation and cost savings from the |
|-------------------------------|--|
| Findings | project. Upon verification, the project demonstrates significant contributions to sustainable development. Socially, it generates employment for both skilled and unskilled workers, enhancing local livelihoods. Environmentally, it reduces GHG emissions by utilizing renewable biomass (bagasse) instead of fossil fuels, thus contributing |
| | to climate change mitigation. Economically, it conserves natural resources like coal and oil and boosts local revenue by increasing the demand for bagasse. Technologically, it promotes the adoption of advanced cogeneration technology, |

| | encouraging other industries to follow suit and reduce reliance on carbon-intensive energy sources. | |
|------------|--|--|
| Conclusion | In conclusion, the project contributes to social benefits by generating employment for both skilled and unskilled workers, enhancing local technological knowledge, and improving national energy security. Environmental benefits include the reduction of GHG emissions, decreased reliance on fossil fuels, and proper disposal of excess bagasse. Economic benefits are evident through job creation, conservation of natural resources, and increased revenue for local farmers. Technological well-being is promoted by encouraging the adoption of cogeneration power plants, reducing dependence on carbon-intensive grid supply, and improving energy availability and quality. Overall, the project significantly supports sustainable development in the region. | |

Section E. Internal quality control

Throughout the verification process, meticulous internal quality control measures were implemented to ensure accuracy and reliability. This included regular internal reviews of procedures, documentation, and reports to quickly address any errors or discrepancies. Verification staff received ongoing training to maintain their proficiency and efficiency. Standard Operating Procedures (SOPs) were established to provide clear guidance on data collection, analysis, and reporting, ensuring consistency and adherence to best practices. Robust documentation management practices were adopted to maintain transparent records of activities, including data sources and methodologies. Peer reviews and team discussions validated findings and ensured consensus on conclusions. Continuous improvement processes were instituted to assess and enhance verification practices, identifying areas for improvement and enhancing overall performance over time.

Section F. Project Verification opinion

The GHG emission reductions were calculated based on UCR Protocols which draws reference from, Applied Baseline Methodology:ACM0006: Electricity and heat generation from biomass (Ver. 16) & UCR Standard for Emission Factor. The

verification was done remotely by way of video calls / verification, phone calls and submission of documents for verification through emails.

SQAC is able to certify that the Emission reductions from 26 MW Bagasse based Cogeneration by M/s. Sahakar Maharshi Shivajirao Narayanrao Nagawade Sahakari Sakhar Karkhana Ltd. Dist. Ahmednagar, Maharashtra, India. (UCR ID – **441**) for the period **01/01/2021 to 31/12/2023** amounts to **60,871, CoUs (60,871 tCO**_{2eq})
